

CONTOSO PLATFORM

Network Security Design

Change Record

Date	Purpose	Version	Change Reference
24-Sep-2026	Initial draft	1.0	First issue for review

Purpose

This document describes the proposed network security design for the Contoso pre-production web applications. It records the current configuration as of 24-Sep-2026, the target design and the changes needed to implement it.

Scope

In scope

- The three web applications and their private endpoints.
- Network security groups and application security groups in the spoke VNet.

Out of scope

- Hub network resources, which are managed by the hub team.

Current State

This section summarises the configuration of the pre-production subscription as of 24-Sep-2026.

Resource	Public access	Private endpoint
app-contoso-portal, Web app	Disabled	10.20.1.4
sql-contoso-data, Azure SQL	Enabled	10.20.1.5

Table 1: Findings

#	Finding	Impact
1	sql-contoso-data allows public access with the 'Allow Azure services' rule.	Any Azure resource can reach the public endpoint, regardless of subscription.

Proposed Architecture

Internet traffic enters through an Application Gateway with WAF. We recommend keeping the database private and removing the public firewall rules once the application teams confirm their dependencies.

Implementation Plan

#	Activity	Owner
1	Disable public access on sql-contoso-data and remove the 'Allow Azure services' rule	Cloud team
